

SAINT PETER'S HEALTHCARE SYSTEM

Treating you better...for life.

How It Works

Telemedicine uses electronic information and telecommunications technologies to enhance patient access to medical care.

Telemedicine can also facilitate interactions among different specialty providers to improve patient care coordination, provide needed services in a variety of settings, and reduce patient wait times for appointments.

Patients can access the
Saint Peter's Telemedicine
application on any mobile device
through its free downloadable
application which can be found on
the Google Play Store or the Apple
App Store. The technology works
with either Firefox or Google Chrome
on any laptop or mobile device that
has Wi-Fi connection, a working
camera, microphone and speaker.

Patients are required to complete a few electronic forms online at least 48 hours prior to their virtual appointment.

Interactive, Real-time, Two-way Communication

Telemedicine Services Available for Medical Genetics and Genomic Medicine Patients

Geneticist Debra Day-Salvatore, MD, PhD, FAAP, FACMG and genetic counselor supervisor Michele Horner, MS, LGC, met with a longtime patient about her individualized care plan except that this time the patient was not on-site, but was still face-to-face with her providers in a virtual consultation.

"We needed an expedited appointment and, in light of everyone's busy schedule, this worked perfectly," says Dr. Day, chair Department of Medical Genetics and Genomic Medicine.

The Department of Medical Genetics and Genomic Medicine is the first department at Saint Peter's University Hospital providing patient consultations and counseling using technology developed by SnapMD. Plans are to expand the service to other departments in the future.

At the moment, patients can connect online with a geneticist, genetic-metabolic dietitian and a licensed genetic counselor. When an in-office consultation is not necessary, the telemedicine experience can be helpful to patients who need repeated follow-up, eliminating the need for them to travel regularly to Saint Peter's.

"Telemedicine improves access to care particularly when barriers such as geography, transportation, limited patient ambulation, home ventilator support, immunodeficiency, or other chronic medical problems are present," says Dr. Day-Salvatore. "Telegenetics allows us to expand our reach outside of our typical catchment area to provide services to other regions, states, and countries where genetic services may be limited or non-existent. It also enables us to provide continuity of care to patients even after they move out-of-state."

The provider begins the telemedicine appointment with the patient who is in the virtual waiting room. During the appointment, both patient and provider can share clinical documents such as lab reports, images and articles pertaining to their individualized care. The patient leaves the telegenetics appointment with recommendations, management plans, a follow up appointment, if it is necessary, and an electronic summary report of the entire virtual appointment.

According to the American Telemedicine Association (ATA), there are currently about 200 telemedicine networks, with 3,500 service sites in the United States. More than half of all the hospitals in the country now use some form of telemedicine, reports the ATA.

"Our telemedicine technology is simple to use for both the medical provider and the patient," says Jordan Tannenbaum, MD, MBA, vice president and chief information officer, Saint Peter's Healthcare System. "This technology allows Saint Peter's to extend the services of our renowned genetics service directly to the patient, removing barriers to care and improving the efficiency of the interaction."
